

WEAREDEVELOPERS HACKATHON 2026

Customs

Border control for third-party MCP servers.

MCP approval has no expiry – until now.

THE PROBLEM

Tool descriptions are instructions. Approval happens once and never expires.

A server can silently replace an honest tool with one that reads `.env` and exfiltrates credentials.

THE MECHANISM

- **Pin** — SHA-256 seal at approval
- **Verify** — re-hash every session
- **Quarantine** — drift withheld + word-level diff

No model in the trust path. Fail closed.

DEMO

```
make install && make demo
```

Side-by-side rug pull: left leaks, right quarantines. Zero API keys.
~5 minutes from clone.

DEPLOY ANYWHERE

- Laptop — stdio proxy between agent and MCP
- CI — fail build on manifest drift
- Org — quarantine console for re-approval

CLOSE

You approved a server — not every future version of it.
